Installing Python

Step 1:

Go to Continuum Analytics, and Download Anaconda for your Operating System. Make sure to get Python 3.XX

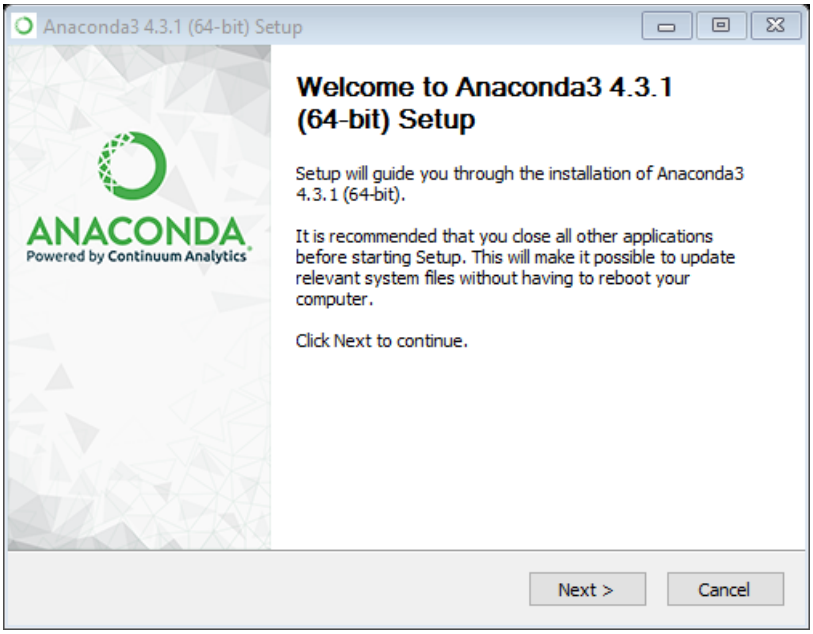

Be sure to download the graphical installer if you are on macOS

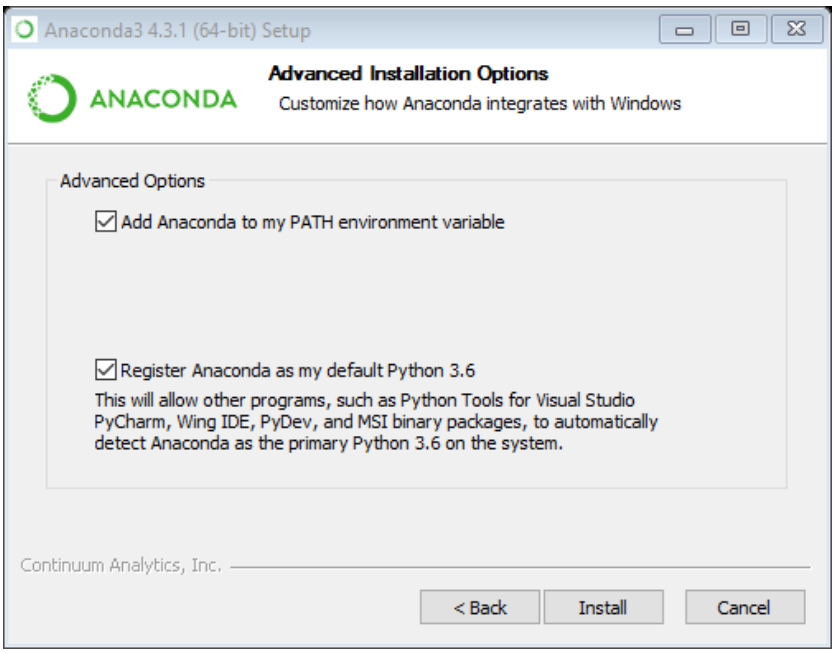

Step 2 (windows and mac):

Run the downloaded installer and follow the instructions

Make sure both boxes are checked for the advanced installation instructions

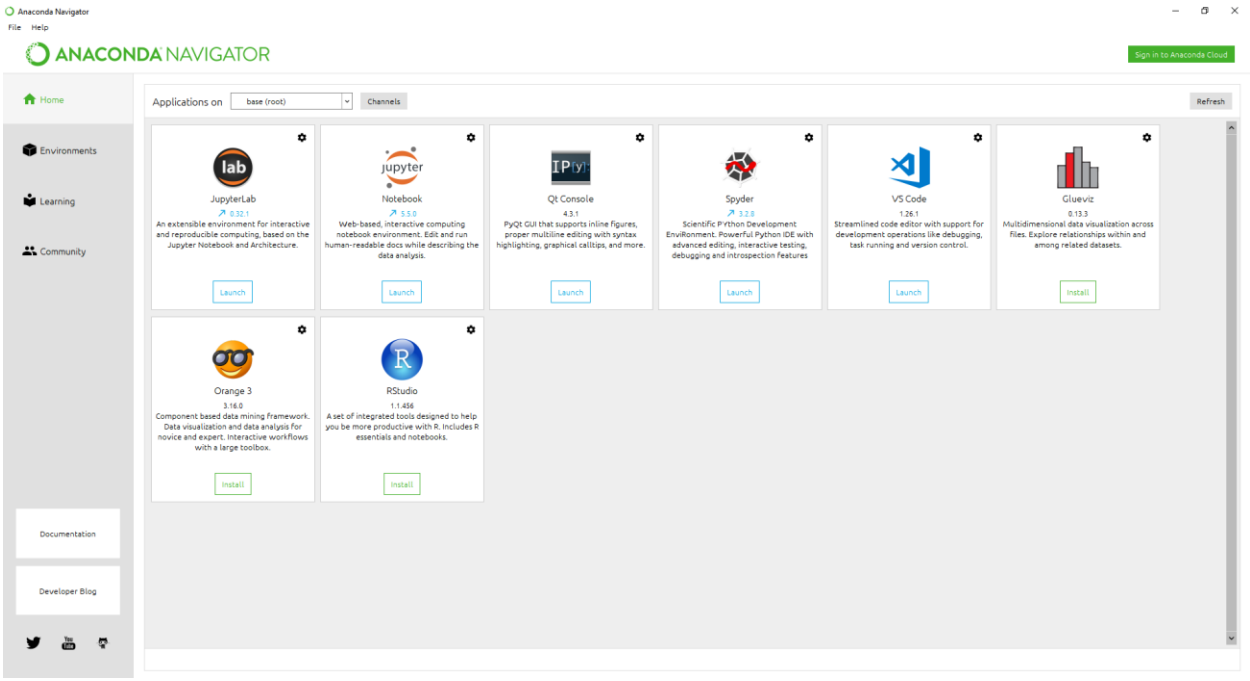

It may take a couple of minutes once the installation has begun.

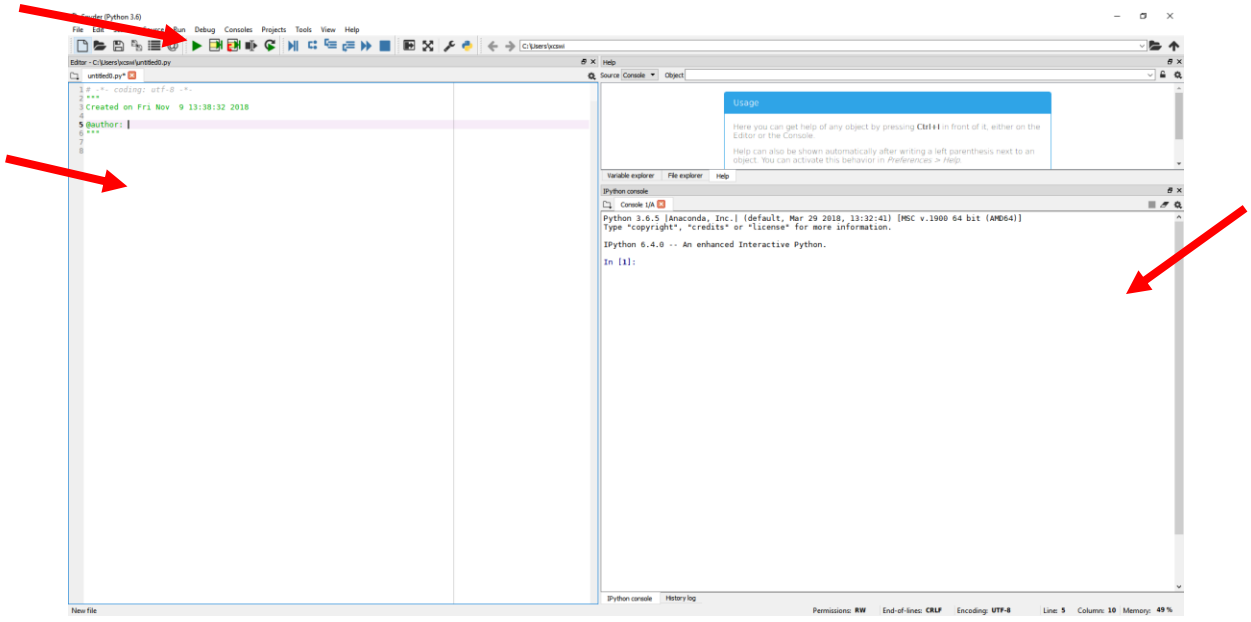

Step 3: Test installation

Once the install completes there should be a new application called Anaconda3 (64bit)

Running it will bring you to the Anaconda Navigator

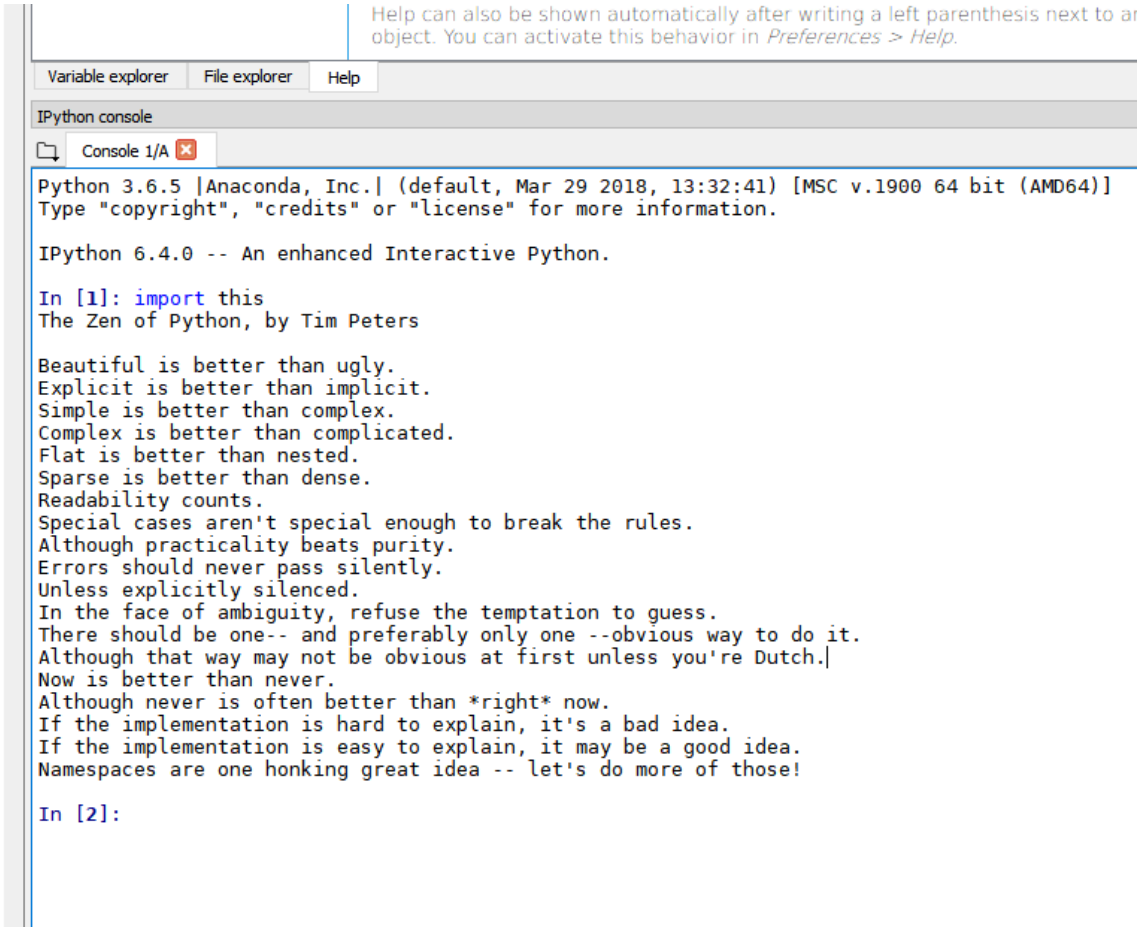

We are going to launch Spyder. The user interface will look something like

On the left panel, you can write and edit your programs. The green triangle above this will execute your program. The lower right panel is a console where you can run commands. Any outputs from your code will show up here.

For the quick test, type ‘import this’ into the console then press enter.

If the zen of python is outputted, then the install was successful.

If you would like some practical experience with Python we recommend visiting Codeacademy.
